		Takes food waste from a family up to 4 people
		Takes food waste from a family up to 8 people
		Needs winter jacket for prolonged temperatures below 5°C
		Supplied with 4.5 litre kitchen caddy
		Requires occasional stirring
		Guaranteed for 10 years
		Keeps wheelie bins clean
		Helps the environment
		Saves landfill
		Does not attract vermin and is safe for pets

"With each Green Johanna having the capacity to treat up to 250kg and each Green Cone the capacity to treat up to 225kg of food waste, the sales alone could divert 410 tonnes from the Cumbrian waste stream every year. These diversions over the guaranteed 10 year lifespan of the products would increase to 4100 tonnes, leading to waste disposal savings to the authority and significant reductions in CO2." **Nick Wright M | Cumbria County Council**

Cone Limited for
dealing with household
organic waste

THE HOUSEHOLDER

how they help

THE ENVIRONMENT

how they help

- No smelly waste
- With no food waste in your bin other rubbish is dry and easy to recycle
- Safe for you and your pets
- Easy to set up and maintain
- Reduces household's carbon footprint

- Save up to 25% of household waste being collected
- Easier recycling household waste
- Reduce the need for landfill
- Less food waste in landfill means reduced greenhouse gases

Green Cone food waste digester

Green Cone accepts all cooked and uncooked food waste including vegetable scraps, meat, fish, bones, dairy products and other surplus organic kitchen material. Nature does the rest, reducing the Cone's contents to its natural components of water and carbon dioxide.

Green Johanna food waste digester & composter

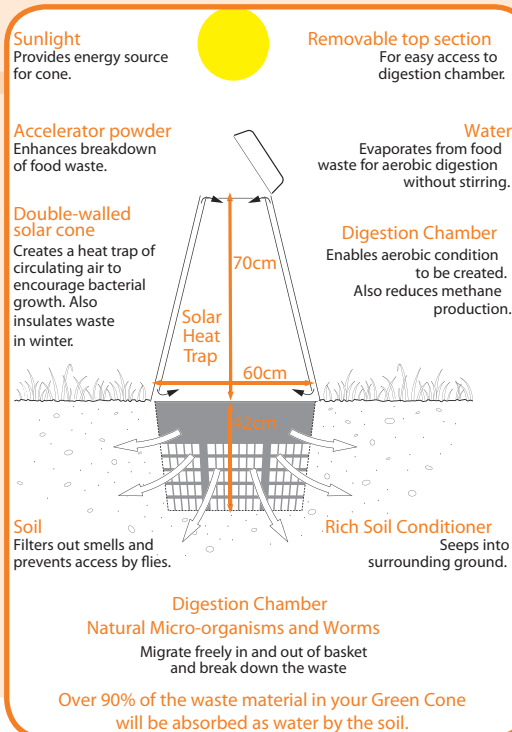

Green Johanna produces rich compost for use in the garden from all cooked and uncooked food waste mixed with organic garden waste. For example, it accepts vegetable scraps, meat, fish, bones and dairy products together with plants, leaves and grass cuttings.

How it works

Designed for a sunny position in a well drained garden, Green Cone is suitable for use by an average family of four people.

The double-walled solar cone creates a heat trap of circulating air, encouraging the growth of harmless bacteria and helping insulate the decaying matter in winter.

A below ground digestion chamber means worms and natural soil organisms can migrate freely in and out of the basket ensuring odourless processing. The digestion chamber may need emptying every few years.

How it works

Designed to sit in a shady position in the garden, the Green Johanna's unique ventilation system enables the contents to reach significantly higher temperatures than traditional garden composters, breaking down waste faster.

Suitable for use all year round, the product is supplied with an optional winter jacket for use when the ambient temperature falls below 5°C for long periods.
